MECHANICAL DATA

Pinning for TSOP381.., TSOP383.., TSOP385..:

1 = OUT, 2 = GND, 3 = V_S

FEATURES

- Very low supply current
- Photo detector and preamplifier in one package
- Internal filter for PCM frequency
- Improved shielding against EMI
- Supply voltage: 2.5 V to 5.5 V
- Improved immunity against ambient light
- Insensitive to supply voltage ripple and noise
- Material categorization:

DESCRIPTION

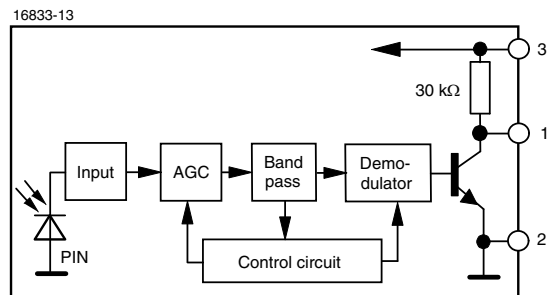

These products are miniaturized receivers for infrared remote control systems. A PIN diode and a preamplifier are assembled on a lead frame, the epoxy package acts as an IR filter.

The demodulated output signal can be directly connected to a microprocessor for decoding. The TSOP381.. is legacy products compatible with all common IR remote control data formats. The TSOP383.. is optimized to better suppress spurious pulses from energy saving fluorescent lamps. The TSOP385.. has an excellent noise suppression. It is immune to dimmed LCD backlighting and any fluorescent lamps. AGC3 and AGC5 may also suppress some data signals in case of continuous transmission. Between these three receiver types, the TSOP383.. is preferred. Customers should initially try the TSOP383.. in their design.

This component has not been qualified according to automotive specifications.

Note

- Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect the device reliability.

SUITABLE DATA FORMAT

This series is designed to suppress spurious output pulses due to noise or disturbance signals. The devices can distinguish data signals from noise due to differences in frequency, burst length, and envelope duty cycle. The data signal should be close to the device's band-pass center frequency (e.g. 38 kHz) and fulfill the conditions in the table below.

When a data signal is applied to the product in the presence of a disturbance, the sensitivity of the receiver is automatically reduced by the AGC to insure that no spurious pulses are present at the receiver's output.

Some examples which are suppressed are:

- DC light (e.g. from tungsten bulbs sunlight)
- Continuous signals at any frequency
- Strongly or weakly modulated patterns from fluorescent lamps with electronic ballasts (see figure 14 or figure 15)

Fig. 14 - IR Disturbance from Fluorescent Lamp with Low Modulation

Fig. 15 - IR Disturbance from Fluorescent Lamp with High Modulation

	TSOP381..	TSOP383..	TSOP385..
Minimum burst length	6 cycles/burst	6 cycles/burst	6 cycles/burst
After each burst of length A gap time is required of	6 to 70 cycles ≥ 10 cycles	6 to 35 cycles ≥ 10 cycles	6 to 24 cycles ≥ 10 cycles
For bursts greater than a minimum gap time in the data stream is needed of	70 cycles > 1.2 x burst length	35 cycles > 6 x burst length	24 cycles > 25 ms
Maximum number of continuous short bursts/second	2000	2000	2000
MCIR code	yes	preferred	yes
RCMM code	yes	preferred	yes
XMP-1, XMP-2 code	yes	preferred	yes
Suppression of interference from fluorescent lamps	Common disturbance patterns are suppressed (example: signal pattern of fig. 14)	Even critical disturbance patterns are suppressed (examples: signal pattern of fig. 14 and fig. 15)	Even critical disturbance patterns are suppressed (examples: signal pattern of fig. 14 and fig. 15)

Notes

- For data formats with long bursts (more than 10 carrier cycles) please see the datasheet for TSOP382..., TSOP384..
- Best choice of AGC for some popular IR-codes:
 - TSOP38336: MCIR, RCMM
 - TSOP38538: Mitsubishi, RECS-80 Code
 - TSOP38338: XMP-1, XMP-2, r-map
- For SIRCS 15 and 20 bit, Sony 12 bit IR-codes, please see the datasheet for TSOP4S40, TSOP2S40
